Make it interesting … typically a home page has an extra-large hero image, and a few featured products featured in a larger rendition.

I'd encourage you to take a look at other online stores for ideas.

Display Home view when clicked

All your pages will have the same header.

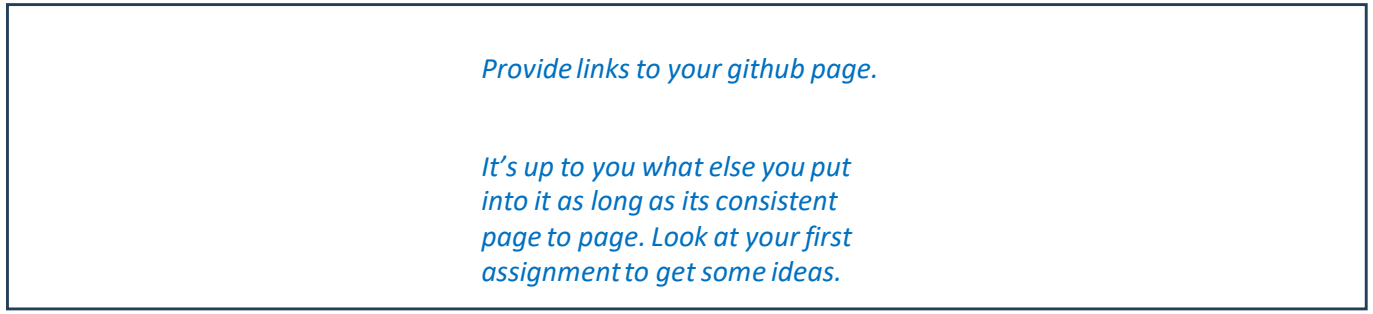

Every time an item is added or removed from cart, update this number

Header

Provide these links to the different views.

Footer

Provide links to your github page.

It's up to you what else you put into it as long as its consistent page to page. Look at your first assignment to get some ideas.

All your pages will have the same footer.

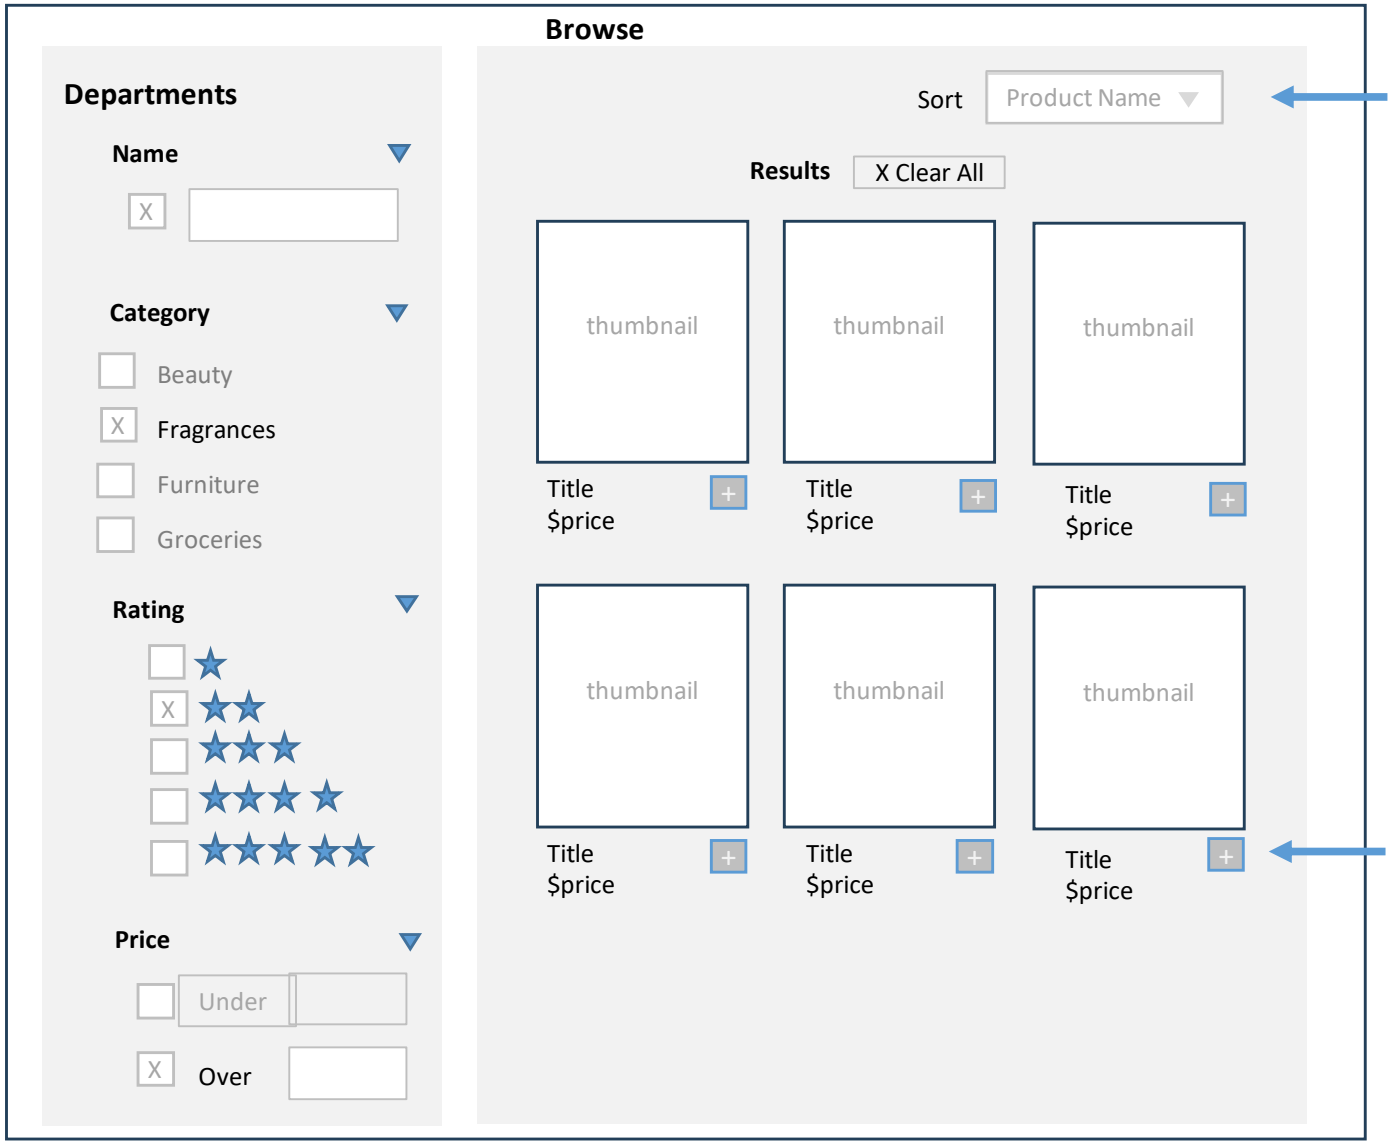

These department links should be additive (ANDs). Be sure to provide visual indication of which ones have been selected. I've indicated two possibilities here (bold and checkboxes).

Each of the four filtering options (name, category, rating, price) should be accordions (click to display; click again to hide).

You will have to create the list of categories from the data. You should use the set object (https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/Set), which is a dictionary-type data structure that will only add an item if it doesn't already exist.

Here I've used stars for ratings but there are other possibilities.

Every time a new filter is added or removed, update the list of matching products. If there are no matches, tell the user that this is the case.

Should also be a way to change the sort order between: product name (A-Z), price, and category. The default should be product name. Changing the sort order shouldn't reset the filters.

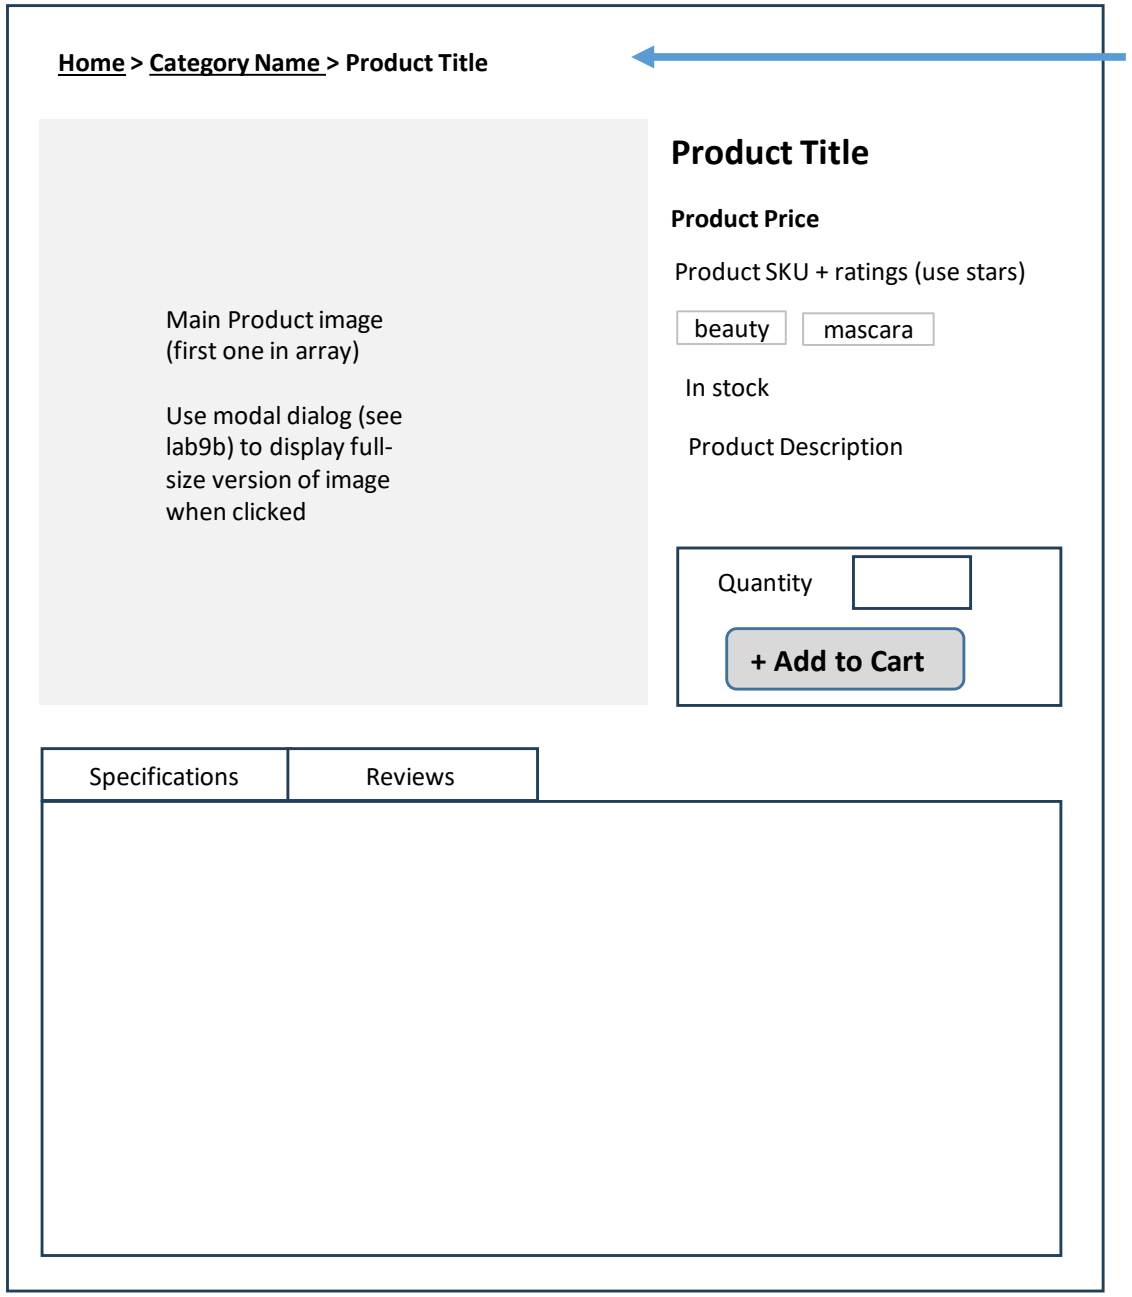

Need to provide a way to clear all the filters.

There are lots of ways of visually displaying this information. I'd encourage you to take a look at other online stores for ideas.

Each of these images and titles should be links to the single product view

Here I've shown just three products per row, but yours will likely show more.

Should also be a way to add product to cart

You need to provide breadcrumb navigation, though I don't except the links to work

Display the product information in some way (I've shown you one possibility here; yours can differ).

Display the tags as pills or boxes

Let user know if in stock or not

You need the ability for user to enter a quantity (default is 1) for when item is added to shopping cart.

When user enters an item to cart, then use some type of toaster notification (see Lab9b).

Use some type of tab or accordion system to display either the product specifications or the product reviews.

For specifications: include weight (use pounds or kg), dimensions (use in or cm), warranty and shipping info, return policy

For reviews, include rating (as stars), comment, date (formatted appropriately, reviewer name in a scrollable list

Shopping Cart

	Items		Price	Quantity	Subtotal
-	thumbnail	Product Title	$80.00	2	$160.00
-	thumbnail	etc			

Shipping

Standard

Canada

Summary

Merchandise	$400.00
Shipping	$40.00
Tax	$20.00
Total	**$460.00**

When checkout is clicked, display a toaster message, clear the shopping cart, and return to home page.

Checkout

Display all the items in the cart, displaying the info shown here.

If cart is empty, tell the user that this is the case, and disable the Shipping options and the checkout button.

There should also be a way to delete each item in the cart. When this happens the info here should be re-displayed.

Shipping choices: Standard, Express, Priority

Destination choices: Canada, United States, International.

Tax is 5% only if Canada

Shipping Cost: If merchandise over $500, then it is free.

Otherwise cost for each depends on destination (CA,US,Int): Standard ($10, $15, $20), Express ($25, $25, $30), Priority ($35,$50,$50)

Modal windows often provide another way to close by clicking on element in upper-right corner

About Us Dialog / Modal Window

Provide a brief description, styled nicely, about what this site is about, what technologies you are using, the group member names, and the URL for the github repo.

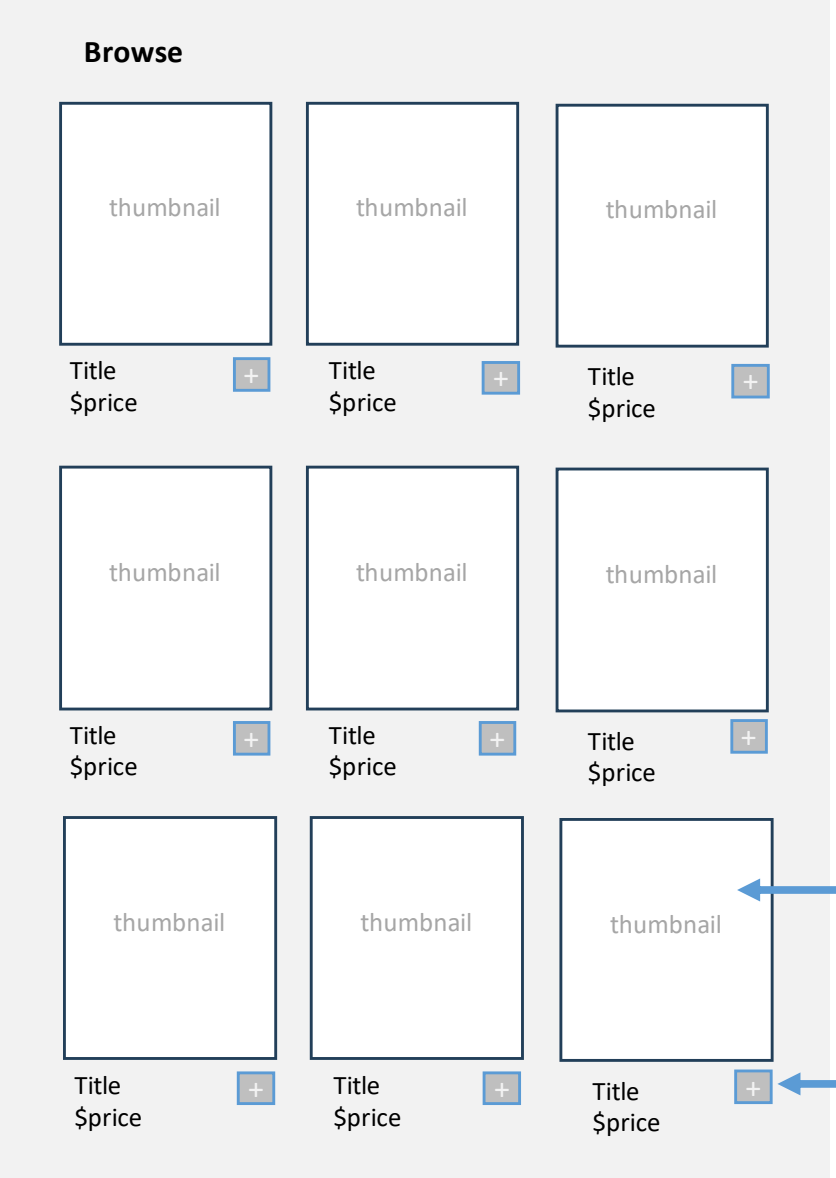

Don't just dump this info together like this: format it in a way that makes it easy to read and pleasing to look at.

Recommend using the <dialog> element for this (see Lab9b) … it's very easy to use!

This should behave like a modal window (like a dialog/popup), which stays until it is closed. Often the underlying view is partly hidden.

Close

Assignment 1 - Milestone

Dynamically display the first 20 products in the products array in the provided JSON file.

The URL for the thumbnail images is included in the data file.

There are no marks for the styling in assignment 1. However, it might make sense to get a start on the styling now for the finished assignment 2 while you have more time.

Here I've shown just three products per row, but yours will likely show more.

Display the product id in a simple alert when the thumbnail is clicked.

Display the product id and title in a simple alert when the Add to Cart is clicked.

index.html

<main>

<article id=home>

You will programmatically show/hide these different elements to implement the different views

<article id=browse>

<section id=filter>

<section id=results>

<article id=singleproduct>

<dialog id=about>
